Linear Maps

Products and Quotients of Vector Spaces

Proposition 1. A nonempty subset A of V is a translate of some subspace of V if and only if $\lambda v + (1 - \lambda)w \in A$ for all $v, w \in A$ and all $\lambda \in \mathbf{F}$.

Exercise 2. Suppose U is a subspace of V such that V/U is finite-dimensional.

- (a) Prove that if W is a finite-dimensional subspace of V and $V = U + W$, then $\dim W \geq \dim V/U$.
- (b) Prove that there exists a finite-dimensional subspace W of V such that $V = U \oplus W$ and $\dim W = \dim V/U$.

Proof. Let $\bar{w}_1 + U, \dots, \bar{w}_m + U$ be a basis of V/U . It can be shown that $V = \text{span}(\bar{w}_1, \dots, \bar{w}_m) \oplus U$. Let $W_0 = \text{span}(\bar{w}_1, \dots, \bar{w}_m)$. Then $V = U \oplus W_0$, as desired.

Now we prove that for each subspace W of V such that $V = U + W$, we have $\dim W \geq m = \dim V/U$. For each \bar{w}_k above, by definition we have $\bar{w}_k = u_k + w_k$ for some $u_k \in U$ and $w_k \in W$. It can be shown from the linear independence of $\bar{w}_1 + U, \dots, \bar{w}_m + U$ that $\bar{w}_1 - u_1, \dots, \bar{w}_m - u_m$ are independent vectors in W . Hence $\dim W \geq m$. \square

Duality

Proposition 3. Suppose V is finite-dimensional and U is a subspace of V . Then¹

$$U = \left\{ v \in V : \varphi(v) = 0 \text{ for every } \varphi \in U^0 \right\}.$$

¹ Compare this result with $(U^\perp)^\perp = U$ where U is a finite-dimensional subspace of inner product space V .

Exercise 4. Suppose V is finite-dimensional and $\varphi_1, \dots, \varphi_n$ is a basis of V' . Prove that there exists a basis of V whose dual basis is precisely $\varphi_1, \dots, \varphi_n$.

Proof. We start from an arbitrary basis u_1, \dots, u_n of V . Let ψ_1, \dots, ψ_n be its dual basis. In this proof, we take the standard basis e_1, \dots, e_n as the basis of \mathbf{F}^n .

Define $S, T \in \mathcal{L}(V, \mathbf{F}^n)$ by

$$T(v) = (\varphi_1(v), \dots, \varphi_n(v)), \quad S(v) = (\psi_1(v), \dots, \psi_n(v)).$$

Then $\mathcal{M}(S, (u_1, \dots, u_n)) = I$.

Let A be the change of basis matrix from ψ 's to φ 's, i.e.,

$$\begin{bmatrix} \varphi_1 & \cdots & \varphi_n \end{bmatrix} = \begin{bmatrix} \psi_1 & \cdots & \psi_n \end{bmatrix} A.$$

Then by the definition of change of basis matrix, we have

$$\mathcal{M}(T, (u_1, \dots, u_n)) = \begin{bmatrix} \mathcal{M}(\varphi_1, (u_1, \dots, u_n)) \\ \vdots \\ \mathcal{M}(\varphi_n, (u_1, \dots, u_n)) \end{bmatrix} = A^t \begin{bmatrix} \mathcal{M}(\psi_1, (u_1, \dots, u_n)) \\ \vdots \\ \mathcal{M}(\psi_n, (u_1, \dots, u_n)) \end{bmatrix}$$

$$= A^t \cdot \mathcal{M}(S, (u_1, \dots, u_n)) = A^t.$$

Consider basis v_1, \dots, v_n of V such that the change of basis matrix from u 's to v 's is $(A^t)^{-1}$.² Thus

$$\mathcal{M}(T, (v_1, \dots, v_n)) = \mathcal{M}(T, (u_1, \dots, u_n)) \cdot \mathcal{M}(I, (v_1, \dots, v_n), (u_1, \dots, u_n)) = I.$$

Then the dual basis of v_1, \dots, v_n is precisely $\varphi_1, \dots, \varphi_n$, as desired. \square

Exercise 5 (A natural isomorphism from primal space onto double dual space). Define $\Lambda : V \rightarrow V''$ by

$$(\Lambda v)(\varphi) = \varphi(v)$$

for each $v \in V$ and $\varphi \in V'$.

- (a) Prove that if $T \in \mathcal{L}(V)$, then $T'' \circ \Lambda = \Lambda \circ T$.
- (b) Prove that if V is finite-dimensional, then Λ is an isomorphism from V onto V'' .

Remarks 6. (a) Suppose V is finite-dimensional. Then V and V' are isomorphic, but finding an isomorphism from V onto V' generally requires choosing a basis of V . In contrast, the isomorphism Λ from V onto V'' does not require a choice of basis and thus is more natural.

- (b) Another natural isomorphism is $\pi' \in \mathcal{L}((V/U)', V')$ where π is the normal quotient map.

Polynomials

Theorem 7. Suppose $p \in \mathcal{P}(\mathbf{F})$ is a nonconstant polynomial of degree m . Then p has at most m zeros in \mathbf{F} .³

Remark 8. Theorem 7 implies that the coefficients of a polynomial are uniquely determined. In particular, the degree of a polynomial is well-defined.

Theorem 9 (Division algorithm for polynomials). Suppose that $p, s \in \mathcal{P}(\mathbf{F})$, with $s \neq 0$. Then there exist unique polynomials $q, r \in \mathcal{P}(\mathbf{F})$ such that $p = sq + r$.

Proof. Let $n = \deg p$ and $m = \deg s$. The case where $n < m$ is trivial. Thus we now assume that $n \geq m$.

The list

$$1, z, \dots, z^{m-1}, s, zs, \dots, z^{n-m}s$$

is linearly independent in $\mathcal{P}_n(\mathbf{F})$. And it also has length $n + 1$. Hence the list is a basis of $\mathcal{P}_n(\mathbf{F})$.

Because $p \in \mathcal{P}_n(\mathbf{F})$, there exist unique constants $a_0, \dots, a_{m-1}, b_0, \dots, b_{n-m} \in \mathbf{F}$ such that

$$\begin{aligned} p &= a_0 + a_1z + \dots + a_{m-1}z^{m-1} + b_0s + b_1zs + \dots + b_{n-m}z^{n-m}s \\ &= (a_0 + a_1z + \dots + a_{m-1}z^{m-1}) + s(b_0 + b_1z + \dots + b_{n-m}z^{n-m}). \end{aligned} \quad \square$$

Exercise 10. Suppose $p, q \in \mathcal{P}(\mathbf{C})$ are nonconstant polynomials with no zeros in common. Let $m = \deg p$ and $n = \deg q$. Prove that there exist $r \in \mathcal{P}_{n-1}(\mathbf{C})$ and $s \in \mathcal{P}_{m-1}(\mathbf{C})$ such that $rp + sq = 1$.⁴

² *Proof Idea.* The change of basis for $V' \rightarrow V'$ corresponds to the transpose of $V \leftarrow V$, where transpose and inverse both come from duality.

³ A useful corollary of this theorem: when a polynomial p has too many zeros, $p = 0$.

⁴ *Proof Idea.* Define $T : \mathcal{P}_{n-1}(\mathbf{C}) \times \mathcal{P}_{m-1}(\mathbf{C}) \rightarrow \mathcal{P}_{m+n-1}(\mathbf{C})$ by $T(r, s) = rp + sq$ and prove the surjectivity of T .

Eigenvalues and Eigenvectors

Invariant Subspaces

Exercise 11. Suppose that $\lambda_1, \dots, \lambda_n \in \mathbf{R}$ are pairwise distinct. Prove that the list $e^{\lambda_1 x}, \dots, e^{\lambda_n x}$ is linearly independent in $\mathbf{R}^{\mathbf{R}}$.

Proof. Let $V = \text{span}(e^{\lambda_1 x}, \dots, e^{\lambda_n x})$.⁵ Define $D \in \mathcal{L}(V)$ by $Df = f'$. Then $e^{\lambda x}$ is an eigenvector of D corresponding to λ . A list of eigenvectors corresponding to distinct eigenvalues is linearly independent. \square

⁵ Alternatively we can let $V = D(\mathbf{R})$.

Exercise 12. Suppose V is finite-dimensional, $T \in \mathcal{L}(V)$, and U is a subspace of V invariant under T . Prove that each eigenvalue of the quotient operator T/U is an eigenvalue of T .

Proof. It suffices to show that $T/U - \lambda I = (T - \lambda I)/U$ is not injective $\implies T - \lambda I$ is not injective. We prove that $T - \lambda I$ is invertible $\implies (T - \lambda I)/U$ is injective.

Suppose $T - \lambda I$ is invertible. U being invariant under T implies that U is invariant under $T - \lambda I$. Thus $(T - \lambda I)v \in U \iff v \in U$. Suppose $((T - \lambda I)/U)(v + U) = 0$. Then $(T - \lambda I)v \in U$, which implies that $v \in U$, i.e., $v + U = 0$. That proves the injectivity of $(T - \lambda I)/U$. \square

Exercise 13. Suppose V is finite-dimensional and $T \in \mathcal{L}(V)$. Prove that T has an eigenvalue if and only if there exists a subspace of V of dimension $\dim V - 1$ that is invariant under T .⁶

⁶ *Proof Idea.* Consider the zero entries in $\mathcal{M}(T)$ and its transpose matrix $\mathcal{M}(T')$.

Proof. We first suppose that T has an eigenvalue λ . Then λ is an eigenvalue of T' . There exists $\varphi \in V'$ such that $\varphi \circ T = T'\varphi = \lambda\varphi$. Extend φ to a basis $\varphi, \varphi_2, \dots, \varphi_n$ of V' and let v, v_2, \dots, v_n be the basis of V whose dual basis is $\varphi, \varphi_2, \dots, \varphi_n$. Then $(\varphi \circ T)v_k = \lambda\varphi(v_k) = 0$ for every k . Because $\varphi(Tv_k) = 0$ for every k , we have $Tv_k \in \text{span}(v_2, \dots, v_n)$. That proves that $\text{span}(v_2, \dots, v_n)$ is invariant under T .

Reversing the steps above leads to an eigenvector of T' , completing the proof. \square

The Minimal Polynomial

Exercise 14 (Companion matrix of a polynomial). Suppose $a_0, \dots, a_{n-1} \in \mathbf{F}$. Let $T \in \mathcal{L}(\mathbf{F}^n)$ be such that $\mathcal{M}(T)$ (with respect to the standard basis) is

$$\begin{bmatrix} 0 & & & & -a_0 \\ 1 & 0 & & & -a_1 \\ & 1 & 0 & & -a_2 \\ & & \ddots & & \vdots \\ & & & 0 & -a_{n-2} \\ & & & 1 & -a_{n-1} \end{bmatrix}$$

Prove that the minimal polynomial of T is the polynomial

$$a_0 + a_1 z + \dots + a_{n-1} z^{n-1} + z^n.$$

Remark 15. This exercise implies that every monic polynomial is the minimal polynomial of some operator. Hence an algorithm that could produce exact eigenvalues for each operators on each \mathbf{F}^n does not exist.

Exercise 16. Prove that every operator on a finite-dimensional vector space of dimension at least 2 has an invariant subspace of dimension 2.

Proof. Let $T \in \mathcal{L}(V)$ and $n = \dim V$. We use induction on n . The base case $n = 2$ is trivial. Now suppose $n > 2$ and the desired result holds for all smaller positive integers. Let p be the minimal polynomial of T .

If T has an eigenvalue λ , then $p(z) = q(z)(z - \lambda)$ for some monic polynomial q with $\deg q = \deg p - 1$. Because $q(T)|_{\text{im}(T - \lambda I)} = 0$, the desired result holds by induction hypothesis if $\dim \text{im}(T - \lambda I) \geq 2$. If $T - \lambda I = 0$ the desired result trivially holds. If $\dim \text{im}(T - \lambda I) = 1$, then $(T - \lambda I)v$ is a scalar multiple of some fixed $u \in V$ for all $v \in V$. Take $w \in V \setminus \text{span}(u)$ and $\text{span}(u, w)$ will satisfy the desired property.

If T has no eigenvalues, then $\mathbf{F} = \mathbf{R}$ and $p(z) = q(z)(z^2 + bz + c)$ for some $b, c \in \mathbf{R}$ with $b^2 < 4c$ and monic polynomial q with $\deg q = \deg p - 2$. If $\dim \text{im}(T^2 + bT + cI) \geq 2$ the desired result holds by induction hypothesis. If $T^2 + bT + cI = 0$, then let $w \in V$ be such that $w \neq 0$. It can be verified that $\text{span}(w, Tw)$ is invariant under T . If $\dim \text{im}(T^2 + bT + cI) = 1$, because $\dim \ker(T^2 + bT + cI)$ is even, n is odd, which implies that T has an eigenvalue. That completes the proof. \square

Commuting Operators

Exercise 17. Suppose $\mathcal{E} \subseteq \mathcal{L}(V)$ and every element of \mathcal{E} is diagonalizable. Prove that there exists a basis of V with respect to which every element of \mathcal{E} has a diagonal matrix if and only if every pair of elements of \mathcal{E} commutes.⁷

Proof. Suppose every pair of elements of \mathcal{E} commutes. We use induction on $n = \dim V$. The base case $n = 1$ is trivial. Now suppose $n > 1$ and the desired result holds for all smaller integers. Without loss of generality, suppose $\mathcal{E} \cap \{\lambda I : \lambda \in \mathbf{F}\} = \emptyset$, or else consider $\mathcal{E} \setminus \{\lambda I : \lambda \in \mathbf{F}\}$.

Let $\lambda_1, \dots, \lambda_m$ be the distinct eigenvalues of $T \in \mathcal{E}$. Then $V = E(\lambda_1, T) \oplus \dots \oplus E(\lambda_m, T)$. Because $E(\lambda_k, T)$ is invariant under every $S \in \mathcal{E}$, it suffices to show that the desired result holds on $E(\lambda_1, T)$. Because $E(\lambda_1, T) \subsetneq V$, it holds by induction hypothesis. The other direction is trivial. \square

Exercise 18. Suppose V is a finite-dimensional nonzero complex vector space. Suppose that $\mathcal{E} \subseteq \mathcal{L}(V)$ is such that S and T commute for all $S, T \in \mathcal{E}$.

- Prove that there is a vector in V that is an eigenvector for every element of \mathcal{E} .
- Prove that there exists a basis of V with respect to which every element of \mathcal{E} has an upper-triangular matrix.⁸

⁷ This exercise extends simultaneous diagonalizability to more than 2 (possibly infinitely many) operators.

⁸ This exercise extends simultaneous upper triangularizability to more than 2 (possibly infinitely many) operators.

Inner Product Spaces

Inner Products and Norms

Theorems 19 (Polarization identities). (a) Suppose V is a real inner product space. Then

$$\langle u, v \rangle = \frac{\|u + v\|^2 - \|u - v\|^2}{4}.$$

(b) Suppose V is a complex inner product space. Then

$$\langle u, v \rangle = \frac{\|u + v\|^2 - \|u - v\|^2 + \|u + iv\|^2 i - \|u - iv\|^2 i}{4}.$$

Exercise 20. Prove that if $\|\cdot\|$ is a norm on U satisfying the parallelogram equality, then there is an inner product $\langle \cdot, \cdot \rangle$ on U such that $\|u\| = \langle u, u \rangle^{1/2}$ for all $u \in U$.⁹

⁹ Recall Theorems 19.

Orthonormal Bases

Exercise 21. Suppose v_1, \dots, v_m is a linearly independent list in V . Prove that the orthonormal list produced by the formulas of the Gram-Schmidt procedure is the only orthonormal list e_1, \dots, e_m in V such that $\langle v_k, e_k \rangle > 0$ and $\text{span}(v_1, \dots, v_k) = \text{span}(e_1, \dots, e_k)$ for each k .

Exercise 22. Suppose v_1, \dots, v_n is a basis of V . Prove that there exists a basis u_1, \dots, u_n of V such that¹⁰

$$\langle u_j, v_k \rangle = \begin{cases} 0 & \text{if } j \neq k, \\ 1 & \text{if } j = k. \end{cases}$$

¹⁰ *Proof Idea.* Linearity in inner product and patterns of 0, 1 inspire the use of linear functionals.

Proof. Define $\varphi_k \in V'$ for each k by $\varphi_k(u) = \langle u, v_k \rangle$. By the Riesz representation theorem, $\varphi_1, \dots, \varphi_n$ is a spanning list in V' . Thus it is a basis of V' . Let u_1, \dots, u_n be the basis of V whose dual basis is $\varphi_1, \dots, \varphi_n$. Then u_1, \dots, u_n satisfies the desired property. \square

Orthogonal Complements and Minimization Problems

Theorem 23 (Riesz representation theorem). Suppose V is finite-dimensional. For each $v \in V$, define $\varphi_v \in V'$ by

$$\varphi_v(u) = \langle u, v \rangle$$

for each $u \in V$. Then $v \mapsto \varphi_v$ is a one-to-one map from V onto V' .

Proof Idea. If $\varphi(u) = \langle u, v \rangle$ holds for all $u \in V$, then $v \in (\ker \varphi)^\perp$. However, $(\ker \varphi)^\perp$ has dimension 1 (except when $\varphi = 0$). Hence we can obtain the right v by choosing an arbitrary nonzero $w \in (\ker \varphi)^\perp$ and then multiplying by an appropriate scalar. \square

Exercise 24. Suppose V is finite-dimensional and $P \in \mathcal{L}(V)$ is such that $P^2 = P$.

- (a) Suppose every vector in $\ker P$ is orthogonal to every vector in $\operatorname{im} P$. Prove that there exists a subspace U of V such that $P = P_U$.¹¹
- (b) Suppose $\|Pv\| \leq \|v\|$ for every $v \in V$. Prove that there exists a subspace U of V such that $P = P_U$.¹²

¹¹ *Proof Idea.* Observe that $\ker P = (\operatorname{im} P)^\perp$. Thus we prove that P and $P_{\operatorname{im} P}$ agree on $\ker P$ and $\operatorname{im} P$.

¹² *Proof Idea.* Observe that among all v 's with the same Pv , the one in $(\ker P)^\perp$ is the shortest. Applying this v makes the best use of the inequality. Thus we prove that P and $P_{(\ker P)^\perp}$ agree on $\ker P$ and $(\ker P)^\perp$.

Propositions 25 (Algebraic properties of the pseudoinverse). *Suppose V is finite-dimensional and $T \in \mathcal{L}(V, W)$.*

- (a) *The pseudoinverse of an orthogonal projection is the operator itself.*
- (b) $\ker T^\dagger = (\operatorname{im} T)^\perp$ and $\operatorname{im} T^\dagger = (\ker T)^\perp$.
- (c) $TT^\dagger T = T$ and $T^\dagger TT^\dagger = T^\dagger$.
- (d) $(T^\dagger)^\dagger = T$.

Operators on Inner Product Spaces

From now on, we suppose that V and W are nonzero finite-dimensional inner product spaces over \mathbb{F} .

Self-Adjoint and Normal Operators

Exercise 26. Suppose $T \in \mathcal{L}(V)$ and $\lambda \in \mathbb{F}$. Prove that

$$\lambda \text{ is an eigenvalue of } T \iff \overline{\lambda} \text{ is an eigenvalue of } T^*.$$

Exercise 27. Suppose $T \in \mathcal{L}(V)$ and U is a subspace of V . Prove that

$$U \text{ is invariant under } T \iff U^\perp \text{ is invariant under } T^*.$$

Exercise 28. Suppose $T \in \mathcal{L}(V)$ is normal. Prove that

$$\ker T^k = \ker T \quad \text{and} \quad \operatorname{im} T^k = \operatorname{im} T.$$

Exercise 29. Suppose $T \in \mathcal{L}(V, W)$. Prove that under the standard identification of V with V' (by Riesz representation theorem) and W with W' , the adjoint map T^* corresponds to the dual map T' . More precisely, prove that

$$T'(\varphi_w) = \varphi_{T^*w}$$

for all $w \in W$.

Remark 30. Furthermore, under this identification of V with V' , the orthogonal complement corresponds to the annihilator; the formulas for $\ker T^*$ and $\operatorname{im} T^*$ become identical to the formulas for $\ker T'$ and $\operatorname{im} T'$. Note that orthogonal complements and adjoints are easier to deal with than annihilators and dual maps.

Spectral Theorem

Theorems 31. (a) Suppose $T \in \mathcal{L}(V)$. Suppose $\mathbf{F} = \mathbf{R}$. Then T is self-adjoint if and only if all pairs of eigenvectors corresponding to distinct eigenvalues of T are orthogonal and $V = E(\lambda_1, T) \oplus \cdots \oplus E(\lambda_m, T)$, where $\lambda_1, \dots, \lambda_m$ denote the distinct eigenvalues of T .

(b) Suppose $T \in \mathcal{L}(V)$. Suppose $\mathbf{F} = \mathbf{C}$. Then T is normal if and only if all pairs of eigenvectors corresponding to distinct eigenvalues of T are orthogonal and $V = E(\lambda_1, T) \oplus \cdots \oplus E(\lambda_m, T)$, where $\lambda_1, \dots, \lambda_m$ denote the distinct eigenvalues of T .

Exercise 32. (a) Suppose $\mathbf{F} = \mathbf{C}$ and $\mathcal{E} \subseteq \mathcal{L}(V)$. Prove that there is an orthonormal basis of V with respect to which every element of \mathcal{E} has a diagonal matrix if and only if S and T are commuting normal operators for all $S, T \in \mathcal{E}$.

(b) Suppose $\mathbf{F} = \mathbf{R}$ and $\mathcal{E} \subseteq \mathcal{L}(V)$. Prove that there is an orthonormal basis of V with respect to which every element of \mathcal{E} has a diagonal matrix if and only if S and T are commuting self-adjoint operators for all $S, T \in \mathcal{E}$.¹³

¹³ This exercise extends the spectral theorems to the context of a collection of commuting operators.

Positive Operators

Exercise 33. For $T \in \mathcal{L}(V)$ and $u, v \in V$, define $\langle u, v \rangle_T$ by $\langle u, v \rangle_T = \langle Tu, v \rangle$.

- (a) Suppose $T \in \mathcal{L}(V)$. Prove that $\langle \cdot, \cdot \rangle_T$ is an inner product on V if and only if T is an invertible positive operator (with respect to the original inner product).
- (b) Prove that every inner product on V is of the form $\langle \cdot, \cdot \rangle_T$ for some invertible positive operator $T \in \mathcal{L}(V)$.

Proof Idea. (b) Let $\langle \cdot, \cdot \rangle_1$ be an inner product on V . We need to find T such that $\langle u, v \rangle_1 = \langle Tu, v \rangle$. Fixing v is not sufficient to find the unique Tu . Thus we fix u and consider $\langle v, u \rangle_1 = \langle v, Tu \rangle$. The map $v \mapsto \langle v, u \rangle_1$ is in V' . Hence we use the Riesz representation theorem to define Tu . \square

Singular Value Decomposition

Exercise 34. Suppose $T \in \mathcal{L}(V, W)$ and $s > 0$. Prove that s is a singular value of T if and only if there exist nonzero vectors $v \in V$ and $w \in W$ such that¹⁴

$$Tv = sw \quad \text{and} \quad T^*w = sv.$$

¹⁴ The vectors v, w satisfying both equations above are called a *Schmidt pair*.

Exercise 35. Suppose $T \in \mathcal{L}(V, W)$. Suppose $s_1 \geq s_2 \geq \cdots \geq s_m > 0$ and e_1, \dots, e_m is an orthonormal list in V and f_1, \dots, f_m is an orthonormal list in W such that

$$Tv = s_1 \langle v, e_1 \rangle f_1 + \cdots + s_m \langle v, e_m \rangle f_m$$

for every $v \in V$.

- (a) Prove that s_1, \dots, s_m are the positive singular values of T .
- (b) Prove that if $k \in \{1, \dots, m\}$, then e_k is an eigenvector of T^*T with corresponding eigenvalue s_k^2 .

Consequences of Singular Value Decomposition

Exercise 36. Suppose $T \in \mathcal{L}(V, W)$. Let $n = \dim V$ and let $s_1 \geq \cdots \geq s_n$ denote the singular values of T . Prove that if $1 \geq k \geq n$, then

$$\min\{\|T|_U\| : U \text{ is a subspace of } V \text{ with } \dim U = k\} = s_{n-k+1}.$$

Remark 37. Compare the result above to that

$$\min\{\|T - S\| : S \in \mathcal{L}(V, W) \text{ and } \dim \operatorname{im} S \leq k\} = s_{k+1}.$$

Exercise 38. Suppose $T \in \mathcal{L}(V)$, $S \in \mathcal{L}(V)$ is a unitary operator, and $R \in \mathcal{L}(V)$ is a positive operator such that $T = SR$. Prove that $R = \sqrt{T^*T}$.

Complexification

Propositions 39 (Properties of complexification). (a) $\lambda \in \mathbf{R}$ is an eigenvalue of T if and only if λ is an eigenvalue of $T_{\mathbf{C}}$.

(b) $\lambda \in \mathbf{C}$ is an eigenvalue of $T_{\mathbf{C}}$ if and only if $\bar{\lambda}$ is an eigenvalue of $T_{\mathbf{C}}$.

(c) The minimal polynomial of $T_{\mathbf{C}}$ equals the minimal polynomial of T .

(d) Suppose V is a real inner product space. For $u, v, w, x \in V$, define

$$\langle u + iv, w + ix \rangle_{\mathbf{C}} = \langle u, w \rangle + \langle v, x \rangle + (\langle v, w \rangle - \langle u, x \rangle)i.$$

Then $\langle \cdot, \cdot \rangle_{\mathbf{C}}$ makes $V_{\mathbf{C}}$ into a complex inner product space. If $u, v \in V$, then

$$\langle u, v \rangle_{\mathbf{C}} = \langle u, v \rangle \quad \text{and} \quad \|u + iv\|_{\mathbf{C}}^2 = \|u\|^2 + \|v\|^2.$$

Proposition 40. Every operator on a finite-dimensional nonzero vector space has an invariant subspace of dimension 1 or 2.

Proof. The case where $\mathbf{F} = \mathbf{C}$ is trivial. Now assume V is a real vector space and $T \in \mathcal{L}(V)$. Then $T_{\mathbf{C}}$ ¹⁵ has an eigenvalue $a + bi$ with $a, b \in \mathbf{R}$. Thus there exist $u, v \in V$, not both 0, such that

$$Tu + iTv = (au - bv) + (av + bu)i.$$

Hence $\operatorname{span}(u, v)$ is invariant under T , as desired. \square

¹⁵ *Proof Idea.* Field extension.
