Linear Maps

Kernals and Images

Exercise 1. Suppose U and V are finite-dimensional and $S \in \mathcal{L}(V,W)$ and $T \in \mathcal{L}(U,V)$. Prove that

$$\dim \ker ST \leq \dim \ker S + \dim \ker T.$$

Proof. Restrict to $Z = \ker ST$. By the fundamental theorem of linear maps,

$$\begin{aligned}
\dim Z &= \dim T(Z) + \dim \ker T|_Z \\
&\leq \dim T(Z) + \dim \ker T \\
&= \dim ST(Z) + \dim \ker S|_{T(Z)} + \dim \ker T \\
&\leq \dim \ker S + \dim \ker T. \qquad \square
\end{aligned}$$

Corollary 2 (Sylvester's rank inequality)**.** *Suppose $A \in \mathbb{F}^{m,n}$ and $B \in \mathbb{F}^{n,p}$ are two matrices. Then*

$$\operatorname{rank} A + \operatorname{rank} B - n \leq \operatorname{rank}(AB).$$

Products and Quotients of Vector Spaces

Exercise 3. Suppose $V_1, \ldots, V_m$ are vector spaces. Prove that $\mathcal{L}(V_1 \times \cdots \times V_m, W)$ and $\mathcal{L}(V_1, W) \times \cdots \times \mathcal{L}(V_m, W)$ are isomorphic vector spaces.

Proof. We construct an isomorphism T between the two vector spaces. For every $\Gamma \in \mathcal{L}(V_1 \times \cdots \times V_m, W)$, define $\varphi_k : V_k \to W$ for each k by

$$\varphi_k(v_k) = \Gamma(0, \ldots, v_k, \ldots, 0)$$

with v_k in the kth slot and 0 in all other slots. It can be verified that $\varphi_k \in \mathcal{L}(V_k, W)$.

Define T by $T(\Gamma) = (\varphi_1, \ldots, \varphi_m)$. It can be verified that T is a linear map. We prove T is an isomorphism by constructing its inverse linear map S.

For every $(\varphi_1, \ldots, \varphi_m) \in \mathcal{L}(V_1, W) \times \cdots \times \mathcal{L}(V_m, W)$, let

$$S(\varphi_1, \ldots, \varphi_m)(v_1, \ldots, v_m) = \varphi_1(v_1) + \cdots + \varphi_m(v_m).$$

It can be shown that S is a linear map, and that $S \circ T = I$ and $T \circ S = I$. That proves T is indeed an isomorphism between the two vector spaces. $\qquad \square$

Proposition 4. *A nonempty subset A of V is a translate of some subspace of V if and only if $\lambda v + (1 - \lambda) w \in A$ for all $v, w \in A$ and all $\lambda \in \mathbb{F}$.*

Proposition 5. *Suppose U is a subspace of V and $v_1 + U, \ldots, v_m + U$ is a basis of V/U and $u_1, \ldots, u_n$ is a basis of U. Then $v_1, \ldots, v_m, u_1, \ldots, u_n$ is a basis of V. In other words, $V = \operatorname{span}(v_1, \ldots, v_m) \oplus U$.* [1]

Exercise 6. Suppose U is a subspace of V such that V/U is finite-dimensional.

[1] $V = \operatorname{span}(v_1, \ldots, v_m) \oplus U$ still holds without the hypothesis that U is finite-dimensional.

(a) Prove that if W is a finite-dimensional subspace of V and $V = U + W$, then $\dim W \geq \dim V/U$.

(b) Prove that there exists a finite-dimensional subspace W of V such that $V = U \oplus W$ and $\dim W = \dim V/U$.

Proof. Let $\overline{w}_1 + U, \ldots, \overline{w}_m + U$ be a basis of V/U. Then by Proposition 5, we have $V = \operatorname{span}(\overline{w}_1, \ldots, \overline{w}_m) \oplus U$. Let $W_0 = \operatorname{span}(\overline{w}_1, \ldots, \overline{w}_m)$, then $V = U \oplus W_0$, as desired.

Now we prove that for each subspace W of V such that $V = U + W$, we have $\dim W \geq m = \dim V/U$. For each $\overline{w}_k$ above, by definition we have $\overline{w}_l = u_k + w_k$ for some $u_k \in U$ and $w_k \in W$. It can be shown from the linear independence of $\overline{w}_1 + U, \ldots, \overline{w}_m + U$ that $\overline{w}_1 - u_1, \ldots, \overline{w}_m - u_m$ are independent vectors in W. Hence $\dim W \geq m$. $\qquad\square$

Duality

Proposition 7. *Suppose V is finite-dimensional and U is a subspace of V. Then*[2]

$$U = \left\{ v \in V : \varphi(v) = 0 \text{ for every } \varphi \in U^0 \right\}.$$

Exercise 8. Suppose V is finite-dimensional and $\varphi_1, \ldots, \varphi_n$ is a basis of V'. Prove that there exists a basis of V whose dual basis is precisely $\varphi_1, \ldots, \varphi_n$.

Proof. We start from an arbitrary basis $u_1, \ldots, u_n$ of V. Let $\psi_1, \ldots, \psi_n$ be its dual basis. In this proof, we take the standard basis $e_1, \ldots, e_n$ as the basis of $\mathbb{F}^n$.

Define $S, T \in \mathcal{L}(V, \mathbb{F}^n)$ by

$$T(v) = (\varphi_1(v), \ldots, \varphi_n(v)), \quad S(v) = (\psi_1(v), \ldots, \psi_n(v)).$$

Then $\mathcal{M}(S, (u_1, \ldots, u_n)) = I$.

Let A be the change of basis matrix from ψ's to φ's, i.e.,

$$\begin{bmatrix} \varphi_1 & \cdots & \varphi_n \end{bmatrix} = \begin{bmatrix} \psi_1 & \cdots & \psi_n \end{bmatrix} A.$$

Then by the definition of change of basis matrix, we have

$$\mathcal{M}(T, (u_1, \ldots, u_n)) = \begin{bmatrix} \mathcal{M}(\varphi_1, (u_1, \ldots, u_n)) \\ \vdots \\ \mathcal{M}(\varphi_n, (u_1, \ldots, u_n)) \end{bmatrix} = A^{\mathsf{t}} \begin{bmatrix} \mathcal{M}(\psi_1, (u_1, \ldots, u_n)) \\ \vdots \\ \mathcal{M}(\psi_n, (u_1, \ldots, u_n)) \end{bmatrix}$$

$$= A^{\mathsf{t}} \cdot \mathcal{M}(S, (u_1, \ldots, u_n)) = A^{\mathsf{t}}.$$

Consider basis $v_1, \ldots, v_n$ of V such that the change of basis matrix from u's to v's is $\left(A^{\mathsf{t}} \right)^{-1}$.[3] Thus

$$\mathcal{M}(T, (v_1, \ldots, v_n)) = \mathcal{M}(T, (u_1, \ldots, u_n)) \cdot \mathcal{M}(I, (v_1, \ldots, v_n), (u_1, \ldots, u_n)) = I.$$

Then the dual basis of $v_1, \ldots, v_n$ is precisely $\varphi_1, \ldots, \varphi_n$, as desired. $\qquad\square$

Exercise 9 (A natural isomorphism from primal space onto double dual space). Define $\Lambda : V \to V''$ by
$$(\Lambda v)(\varphi) = \varphi(v)$$
for each $v \in V$ and $\varphi \in V'$.

(a) Prove that if $T \in \mathcal{L}(V)$, then $T'' \circ \Lambda = \Lambda \circ T$.

(b) Prove that if V is finite-dimensional, then Λ is an isomorphism from V onto V''.

Remarks 10. (a) Suppose V is finite-dimensional. Then V and V' are isomorphic, but finding an isomorphism from V onto V' generally requires choosing a basis of V. In contrast, the isomorphism Λ from V onto V'' does not require a choice of basis and thus is more natural.

(b) Another natural isomorphism is $\pi' \in \mathcal{L}((V/U)', V')$ where π is the normal quotient map.

Polynomials

Theorem 11. *Suppose $p \in \mathcal{P}(\mathbb{F})$ is a nonconstant polynomial of degree m. Then p has at most m zeros in $\mathbb{F}$.* [4]

Remark 12. Theorem 11 implies that the coefficients of a polynomial are uniquely determined. In particular, the *degree* of a polynomial is well-defined.

Theorem 13 (Division algorithm for polynomials)**.** *Suppose that $p, s \in \mathcal{P}(\mathbb{F})$, with $s \neq 0$. Then there exist unique polynomials $q, r \in \mathcal{P}(\mathbb{F})$ such that $p = sq + r$.*

Proof. Let $n = \deg p$ and $m = \deg s$. The case where $n < m$ is trivial. Thus we now assume that $n \geq m$.

The list
$$1, z, \ldots, z^{m-1}, s, zs, \ldots, z^{n-m}s$$
is linearly independent in $\mathcal{P}_n(\mathbb{F})$. And it also has length $n + 1$. Hence the list is a basis of $\mathcal{P}_n(\mathbb{F})$.

Because $p \in \mathcal{P}_n(\mathbb{F})$, there exist unique constants $a_0, \ldots, a_{m-1}, b_0, \ldots, b_{n-m} \in \mathbb{F}$ such that

$$p = a_0 + a_1 z + \cdots + a_{m-1}z^{m-1} + b_0 s + b_1 zs + \cdots + b_{n-m}z^{n-m}s$$
$$= \left(a_0 + a_1 z + \cdots + a_{m-1}z^{m-1} \right) + s\left(b_0 + b_1 z + \cdots + b_{n-m}z^{n-m} \right). \qquad \square$$

Exercise 14. Suppose $p, q \in \mathcal{P}(\mathbb{C})$ are nonconstant polynomials with no zeros in common. Let $m = \deg p$ and $n = \deg q$. Prove that there exist $r \in \mathcal{P}_{n-1}(\mathbb{C})$ and $s \in \mathcal{P}_{m-1}(\mathbb{C})$ such that $rp + sq = 1$. [5]

---

[4] A useful corollary of this theorem: when a polynomial p has too many zeros, $p = 0$.

[5] *Proof Idea.* Define $T : \mathcal{P}_{n-1}(\mathbb{C}) \times \mathcal{P}_{m-1}(\mathbb{C}) \to \mathcal{P}_{m+n-1}(\mathbb{C})$ by $T(r, s) = rp + sq$ and prove the surjectivity of T.

Eigenvalues and Eigenvectors

Invariant Subspaces

Exercise 15. Suppose that $\lambda_1, \ldots, \lambda_n \in \mathbb{R}$ are pairwise distinct. Prove that the list $e^{\lambda_1 x}, \ldots, e^{\lambda_n x}$ is linearly independent in $\mathbb{R}^{\mathbb{R}}$.

Proof. Let $V = \operatorname{span}(e^{\lambda_1 x}, \ldots, e^{\lambda_n x})$.[6] Define $D \in \mathcal{L}(V)$ by $Df = f'$. Then $e^{\lambda x}$ is an eigenvector of D corresponding to λ. A list of eigenvectors corresponding to distinct eigenvalues is linearly independent. $\qquad\square$

[6] Alternatively we can let $V = D(\mathbb{R})$.

Exercise 16. Suppose V is finite-dimensional, $T \in \mathcal{L}(V)$, and U is a subspace of V invariant under T. Prove that each eigenvalue of the quotient operator T/U is an eigenvalue of T.

Proof. It suffices to show that $T/U - \lambda I = (T - \lambda I)/U$ is not injective $\implies T - \lambda I$ is not injective. We prove that $T - \lambda I$ is invertible $\implies (T - \lambda I)/U$ is injective.

Suppose $T - \lambda I$ is invertible. U being invariant under T implies that U is invariant under $T - \lambda I$. Thus $(T - \lambda I)v \in U \iff v \in U$. Suppose $((T - \lambda I)/U)(v + U) = 0$. Then $(T - \lambda I)v \in U$, which implies that $v \in U$, i.e., $v + U = 0$. That proves the injectivity of $(T - \lambda I)/U$. $\qquad\square$

Exercise 17. Suppose V is finite-dimensional and $T \in \mathcal{L}(V)$. Prove that T has an eigenvalue if and only if there exists a subspace of V of dimension $\dim V - 1$ that is invariant under T.[7]

[7] *Proof Idea.* Consider the zero entries in $\mathcal{M}(T)$ and its transpose matrix $\mathcal{M}(T')$.

Proof. We first suppose that T has an eigenvalue λ. Then λ is an eigenvalue of T'. There exists $\varphi \in V'$ such that $\varphi \circ T = T'\varphi = \lambda\varphi$. Extend φ to a basis $\varphi, \varphi_2, \ldots, \varphi_n$ of V' and let $v, v_2, \ldots, v_n$ be the basis of V whose dual basis is $\varphi, \varphi_2, \ldots, \varphi_n$. Then $(\varphi \circ T)v_k = \lambda\varphi(v_k) = 0$ for every k. Because $\varphi(Tv_k) = 0$ for every k, we have $Tv_k \in \operatorname{span}(v_2, \ldots, v_n)$. That proves that $\operatorname{span}(v_2, \ldots, v_n)$ is invariant under T.

Reversing the steps above leads to an eigenvector of T', completing the proof. $\qquad\square$

The Minimal Polynomial

Exercise 18 (Companion matrix of a polynomial). Suppose $a_0, \ldots, a_{n-1} \in \mathbb{F}$. Let $T \in \mathcal{L}(\mathbb{F}^n)$ be such that $\mathcal{M}(T)$ (with respect to the standard basis) is

$$\begin{bmatrix} 0 & & & & & -a_0 \\ 1 & 0 & & & & -a_1 \\ & 1 & 0 & & & -a_2 \\ & & \ddots & & & \vdots \\ & & & & 0 & -a_{n-2} \\ & & & & 1 & -a_{n-1} \end{bmatrix}$$

Prove that the minimal polynomial of T is the polynomial

$$a_0 + a_1 z + \cdots + a_{n-1} z^{n-1} + z^n.$$

Remark 19. This exercise implies that every monic polynomial is the minimal polynomial of some operator. Hence an algorithm that could produce exact eigenvalues for each operators on each $\mathbb{F}^n$ does not exist.

Exercise 20. Prove that every operator on a finite-dimensional vector space of dimension at least 2 has an invariant subspace of dimension 2.

Proof. Let $T \in \mathcal{L}(V)$ and $n = \dim V$. We use induction on n. The base case $n = 2$ is trivial. Now suppose $n > 2$ and the desired result holds for all smaller positive integers. Let p be the minimal polynomial of T.

If T has an eigenvalue λ, then $p(z) = q(z)(z - \lambda)$ for some monic polynomial q with $\deg q = \deg p - 1$. Because $q(T)|_{\mathrm{im}(T-\lambda I)} = 0$, the desired result holds by induction hypothesis if $\dim \mathrm{im}(T - \lambda I) \geq 2$. If $T - \lambda I = 0$ the desired result trivially holds. If $\dim \mathrm{im}(T - \lambda I) = 1$, then $(T - \lambda I)v$ is a scalar multiple of some fixed $u \in V$ for all $v \in V$. Take $w \in V \backslash \mathrm{span}(u)$ and $\mathrm{span}(u, w)$ will satisfy the desired property.

If T has no eigenvalues, then $\mathbb{F} = \mathbb{R}$ and $p(z) = q(z)(z^2 + bz + c)$ for some $b, c \in \mathbb{R}$ with $b^2 < 4c$ and monic polynomial q with $\deg q = \deg p - 2$. If $\dim \mathrm{im}(T^2 + bT + cI) \geq 2$ the desired result holds by induction hypothesis. If $T^2 + bT + cI = 0$, then let $w \in V$ be such that $w \neq 0$. It can be verified that $\mathrm{span}(w, Tw)$ is invariant under T. If $\dim \mathrm{im}(T^2 + bT + cI) = 1$, because $\dim \ker(T^2 + bT + cI)$ is even, n is odd, which implies that T has an eigenvalue. That completes the proof. $\square$

Commuting Operators

Exercise 21. Suppose $\mathcal{E} \subseteq \mathcal{L}(V)$ and every element of $\mathcal{E}$ is diagonalizable. Prove that there exists a basis of V with respect to which every element of $\mathcal{E}$ has a diagonal matrix if and only if every pair of elements of $\mathcal{E}$ commutes.[8]

[8] This is an extension of simultaneous diagonalizability to more than 2 (possibly infinitely many) operators.

Proof. Suppose every pair of elements of $\mathcal{E}$ commutes. The other direction is trivial. We use induction on $n = \dim V$. The base case $n = 1$ is trivial. Now suppose $n > 1$ and the desired result holds for all smaller integers. Without loss of generality, suppose $\mathcal{E} \cap \{\lambda I : \lambda \in \mathbb{F}\} = \emptyset$, or else consider $\mathcal{E} \backslash \{\lambda I : \lambda \in \mathbb{F}\}$.

Let $\lambda_1, \ldots, \lambda_m$ be the distinct eigenvalues of $T \in \mathcal{E}$. Then $V = E(\lambda_1, T) \oplus \cdots \oplus E(\lambda_m, T)$. Because $E(\lambda_k, T)$ is invariant under every $S \in \mathcal{E}$, it suffices to show that the desired result holds on $E(\lambda_1, T)$. Because $E(\lambda_1, T) \subsetneq V$, it holds by induction hypothesis, completing the proof. $\square$

Exercise 22. Suppose V is a finite-dimensional nonzero complex vector space. Suppose that $\mathcal{E} \subseteq \mathcal{L}(V)$ is such that S and T commute for all $S, T \in \mathcal{E}$.

(a) Prove that there is a vector in V that is an eigenvector for every element of $\mathcal{E}$.

(b) Prove that there exists a basis of V with respect to which every element of $\mathcal{E}$ has an upper-triangular matrix.[9]

[9] This is an extension of simultaneous upper triangularizability to more than 2 (possibly infinitely many) operators.

Inner Product Spaces

Inner Products and Norms

Theorems 23 (Polarization identities). *(a) Suppose V is a real inner product space. Then*
$$\langle u, v \rangle = \frac{\|u+v\|^2 - \|u-v\|^2}{4}.$$

(b) Suppose V is a complex inner product space. Then
$$\langle u, v \rangle = \frac{\|u+v\|^2 - \|u-v\|^2 + \|u+iv\|^2\, i - \|u-iv\|^2\, i}{4}.$$

Exercise 24. Prove that if $\|\cdot\|$ is a norm on U satisfying the parallelogram equality, then there is an inner product $\langle \cdot, \cdot \rangle$ on U such that $\|u\| = \langle u, u \rangle^{1/2}$ for all $u \in U$.[10]

[10] Recall Theorems 23.

Orthonormal Bases

Exercise 25. Suppose $v_1, \ldots, v_m$ is a linearly independent list in V. Prove that the orthonormal list produced by the formulas of the Gram-Schmidt procedure is the only orthonormal list $e_1, \ldots, e_m$ in V such that $\langle v_k, e_k \rangle > 0$ for each k.

Exercise 26. Suppose V is finite-dimensional. Suppose $\langle \cdot, \cdot \rangle_1, \langle \cdot, \cdot \rangle_2$ are inner products on V with corresponding norms $\|\cdot\|_1$ and $\|\cdot\|_2$. Prove that there exists $b, c > 0$ such that $b\|v\|_2 \le \|v\|_1 \le c\|v\|_2$ for every $v \in V$.[11]

[11] Note that *Proof 1* does not use the hypothesis that $\|\cdot\|_1$ and $\|\cdot\|_2$ are associated with an inner product respectively.

Proof. Without loss of generality, suppose $V = \mathbb{F}^n$, $\|x\|_1^2 = x^t A x$, and $\|x\|_2^2 = x^t B x$, where A, B are positive-definite and B is diagonal.[12] Note that $\lambda B - A$ is Hermitian and hence diagonalizable. It suffices to show that there exists $\lambda > 0$ such that $\lambda B - A$ is positive-definite. Such a λ exists by the Gershgorin disk theorem, as desired. $\square$

[12] *Proof Idea.* Fixing an orthonormal basis naturally leads to a (simple) diagonal matrix.

Exercise 27. Suppose $\mathbb{F} = \mathbb{C}$ and V is finite-dimensional. Prove that if $T \in \mathcal{L}(V)$ is such that 1 is the only eigenvalue of T and $\|Tv\| \le \|v\|$ for all $v \in V$, then T is the identity operator.

Proof. By Schur's theorem, there exists an orthonormal basis $e_1, \ldots, e_m$ of V with respect to which T has an upper-triangular matrix. Then all entries on the diagonal of $\mathcal{M}(T)$ is 1. Any $\mathcal{M}(T)_{j,k} \ne 0$ with $j \ne k$ would contradict $\|Te_k\| \le \|e_k\|$. That proves that $\mathcal{M}(T) = I$, as desired. $\square$

Exercise 28. Suppose $v_1, \ldots, v_n$ is a basis of V. Prove that there exists a basis $u_1, \ldots, u_n$ of V such that[13]
$$\langle u_j, v_k \rangle = \begin{cases} 0 & \text{if } j \ne k, \\ 1 & \text{if } j = k. \end{cases}$$

[13] *Proof Idea.* Linearity in inner product and and patterns of $0, 1$ inspire the use of linear functionals.

Proof. Define $\varphi_k \in V'$ for each k by $\varphi_k(u) = \langle u, v_k \rangle$. By the Riesz representation theorem, $\varphi_1, \ldots, \varphi_n$ is a spanning list in V'. Thus it is a basis of V'. Let $u_1, \ldots, u_n$ be the basis of V whose dual basis is $\varphi_1, \ldots, \varphi_n$. Then $u_1, \ldots, u_n$ satisfies the desired property. $\square$

Orthogonal Complements and Minimization Problems

Theorem 29 (Riesz representation theorem). *Suppose V is finite-dimensional. For each $v \in V$, define $\varphi_v \in V'$ by*

$$\varphi_v(u) = \langle u, v \rangle$$

for each $u \in V$. Then $v \mapsto \varphi_v$ is a one-to-one map from V onto V'. [14]

Proof. The injectivity is trivial. We prove the surjectivity. Suppose $\varphi \in V'$. The case where $\varphi = 0$ is trivial. Thus assume $\varphi \neq 0$. Hence $\ker \varphi \neq V$, which implies that $(\ker \varphi)^\perp \neq \{0\}$. Let $w \in (\ker \varphi)^\perp$ be such that $w \neq 0$. Let [15]

$$v = \frac{\overline{\varphi(w)}}{\|w\|^2} w. \tag{29.1}$$

Then $v \in (\ker \varphi)^\perp$ and $v \neq 0$. Now we prove that $\varphi(u) = \langle u, v \rangle$ for each $u \in V$.

Let $u \in V$. The orthogonal decomposition leads to

$$u = \frac{\langle u, v \rangle}{\|v\|^2} v + \left(u - \frac{\langle u, v \rangle}{\|v\|^2} v \right),$$

where the second term is orthogonal to v and thus in $\ker \varphi$. Applying φ to both sides, we have

$$\varphi(u) = \frac{\langle u, v \rangle}{\|v\|^2} \varphi(v). \tag{29.2}$$

By (29.1), we have

$$\|v\| = \frac{|\varphi(w)|}{\|w\|}, \qquad \varphi(v) = \frac{|\varphi(w)|^2}{\|w\|^2}.$$

Applying them to (29.2) leads to $\varphi(u) = \langle u, v \rangle$, as desired. $\qquad \square$

Exercise 30. Suppose V is finite-dimensional and $P \in \mathcal{L}(V)$ is such that $P^2 = P$.

(a) Suppose every vector in $\ker P$ is orthogonal to every vector in $\operatorname{im} P$. Prove that there exists a subspace U of V such that $P = P_U$. [16]

(b) Suppose $\|Pv\| \leq \|v\|$ for every $v \in V$. Prove that there exists a subspace U of V such that $P = P_U$. [17]

Propositions 31 (Algebraic properties of the pseudoinverse). *Suppose V is finite-dimensional and $T \in \mathcal{L}(V, W)$.*

(a) *The pseudoinverse of an orthogonal projection is the operator itself.*

(b) $\ker T^\dagger = (\operatorname{im} T)^\perp$ *and* $\operatorname{im} T^\dagger = (\ker T)^\perp$.

(c) $TT^\dagger T = T$ *and* $T^\dagger T T^\dagger = T^\dagger$.

(d) $\left(T^\dagger \right)^\dagger = T$.

Operators on Inner Product Spaces

From now on, we suppose that V and W are nonzero finite-dimensional inner product spaces over $\mathbb{F}$.

---

[14] *Proof Idea.* If $\varphi(u) = \langle u, v \rangle$ holds for all $u \in V$, then $v \in (\ker \varphi)^\perp$. However, $(\ker \varphi)^\perp$ has dimension 1 (except when $\varphi = 0$). Hence we can obtain the right v by choosing an arbitrary nonzero $w \in (\ker \varphi)^\perp$ and then multiplying by an appropriate scalar.

[15] *Proof Idea.* Apply w to u to find the supposedly right scalar c in $\varphi(u) = \langle u, cw \rangle$.

[16] *Proof Idea.* Observe that $\ker P = (\operatorname{im} P)^\perp$. Thus we prove that P and $P_{\operatorname{im} P}$ agree on $\ker P$ and $\operatorname{im} P$.

[17] *Proof Idea.* Observe that among all v's with the same Pv, the one in $(\ker P)^\perp$ is the shortest. Applying this v makes the best use of the inequality. Thus we prove that P and $P_{(\ker P)^\perp}$ agree on $\ker P$ and $(\ker P)^\perp$.

Self-Adjoint and Normal Operators

Exercise 32. Suppose $T \in \mathcal{L}(V)$ and $\lambda \in \mathbb{F}$. Prove that

$$\lambda \text{ is an eigenvalue of } T \iff \bar{\lambda} \text{ is an eigenvalue of } T^*.$$

Exercise 33. Suppose $T \in \mathcal{L}(V)$ and U is a subspace of V. Prove that

$$U \text{ is invariant under } T \iff U^\perp \text{ is invariant under } T^*.$$

Exercise 34. Suppose $T \in \mathcal{L}(V)$ is normal. Prove that

$$\ker T^k = \ker T \quad \text{and} \quad \operatorname{im} T^k = \operatorname{im} T.$$

Exercise 35. Suppose $T \in \mathcal{L}(V,W)$. Prove that under the standard identification of V with V' (by Riesz representation theorem) and W with W', the adjoint map T^* corresponds to the dual map T'. More precisely, prove that

$$T'(\varphi_w) = \varphi_{T^*w}$$

for all $w \in W$.

Remark 36. Furthermore, under this identification of V with V', the orthogonal complement corresponds to the annihilator; the formulas for $\ker T^*$ and $\operatorname{im} T^*$ become identical to the formulas for $\ker T'$ and $\operatorname{im} T'$. Note that orthogonal complements and adjoints are easier to deal with than annihilators and dual maps.

Spectral Theorem

Propositions 37.   *(a) Suppose $\mathbb{F} = \mathbb{R}$ and $T \in \mathcal{L}(V)$. Then T is self-adjoint if and only if all pairs of eigenvectors corresponding to distinct eigenvalues of T are orthogonal and $V = E(\lambda_1, T) \oplus \cdots \oplus E(\lambda_m, T)$, where $\lambda_1, \ldots, \lambda_m$ denote the distinct eigenvalues of T.*

   (b) Suppose $\mathbb{F} = \mathbb{C}$ and $T \in \mathcal{L}(V)$. Then T is normal if and only if all pairs of eigenvectors corresponding to distinct eigenvalues of T are orthogonal and $V = E(\lambda_1, T) \oplus \cdots \oplus E(\lambda_m, T)$, where $\lambda_1, \ldots, \lambda_m$ denote the distinct eigenvalues of T.

Positive Operators

Complexifcation

Definition 38. The complexification of V, denoted by $V_{\mathbb{C}}$, equals $V \times V$ with normal addition and real scalar multiplication for product space. But we write an element (u, v) of $V_{\mathbb{C}}$ as $u + iv$. Complex scalar multiplication is defined by

$$(a + bi)(u + iv) = (au - bv) + i(av + bu)$$

for all $a, b \in \mathbb{R}$ and all $u, v \in V$.[18]

[18] Think of V as a subset of $V_{\mathbb{C}}$ by identifying $u \in V$ with $u + i0$. The construction of $V_{\mathbb{C}}$ from V can then be thought of as generalizing the construction of $\mathbb{C}^n$ from $\mathbb{R}^n$.

Propositions 39 (Properties of complexification).   *(a) $\lambda \in \mathbb{R}$ is an eigenvalue of T if and only if λ is an eigenvalue of $T_{\mathbb{C}}$.*

(b) $\lambda \in \mathbb{C}$ is an eigenvalue of $T_{\mathbb{C}}$ if and only if $\overline{\lambda}$ is an eigenvalue of $T_{\mathbb{C}}$.

(c) The minimal polynomial of $T_{\mathbb{C}}$ equals the minimal polynomial of T.

(d) Suppose V is a real inner product space. For $u, v, w, x \in V$, define

$$\langle u + iv, w + ix \rangle_{\mathbb{C}} = \langle u, w \rangle + \langle v, x \rangle + (\langle v, w \rangle - \langle u, x \rangle)i.$$

Then $\langle \cdot, \cdot \rangle_{\mathbb{C}}$ makes $V_{\mathbb{C}}$ into a complex inner product space. If $u, v \in V$, then

$$\langle u, v \rangle_{\mathbb{C}} = \langle u, v \rangle \quad and \quad \|u + iv\|_{\mathbb{C}}^2 = \|u\|^2 + \|v\|^2.$$

Proposition 40. *Every operator on a finite-dimensional nonzero vector space has an invariant subspace of dimension 1 or 2.*

Proof. The case where $\mathbb{F} = \mathbb{C}$ is trivial. Now assume V is a real vector space and $T \in \mathcal{L}(V)$. Then $T_{\mathbb{C}}$ [19] has an eigenvalue $a + bi$ with $a, b \in \mathbb{R}$. Thus there exist $u, v \in V$, not both 0, such that

$$Tu + iTv = (au - bv) + (av + bu)i.$$

Hence $\mathrm{span}(u, v)$ is invariant under T, as desired. $\square$

[19] *Proof Idea.* Field extension.
